

# About Setup Guide

This section is a post installation guide for setting up ActiveAccess for testing. It describes, at a high level, the steps involved in setting up issuers, signing certificates and configuring cards for various payment scenarios, prior to testing. It also covers the steps involved in device configuration, setting up remote / external authentication, archiving and RBA. It should be read in conjunction with [Administration UI](#), which provides additional information on completing each step.

## Document Conventions

The following colours are used to indicate in which environment setup steps are to be performed.

| Colour                                                                              | Environment                                                                                        |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
|  | ActiveAccess Administration                                                                        |
|  | ActiveMerchant Test Payment Page (GPayments MPI (ActiveMerchant)) or an equivalent third-party MPI |
|  | GPayments Licensing                                                                                |
|  | Certificate Authority                                                                              |

## ACS URL

A blue rectangular button with rounded corners containing the text "Update Local ACS Settings" in white.

System Management > ACS Settings > Authentication server: Local or Remote

1. Enter the **ACS URL** (e.g. https://yourserverip:port/acs/pa)
2. Click the **Apply** button.

# Issuer Groups and Issuers

## Configure a New Issuer Group (Optional)

### System Management > Group Management

- Check for an Issuer Group relevant to the client by looking under the **Group Name** column.
- If the required Issuer Group exists, go to [Configure an Issuer](#), otherwise click the *New Issuer Group* link
- Enter the Issuer Group **Name** (e.g. Company Issuer Group)
- You may skip the remaining fields or fill them, as appropriate
- Click the **Apply** button.

#### Note

Cryptographic keys are created for the issuer signing certificate and CAVV validation.

## Configure an Issuer

### System Management > Issuer Management

- Check for a relevant issuer by looking under the **Issuer Name** column or searching for it by **Issuer Name**
- If the issuer exists, go to Section 4.3 - Request and Update Issuer License, otherwise click the *New Issuer* link
- Enter the Issuer **Name** (e.g. Test Issuer, Test Bank)
- Select the Issuer Group, if one was created in Section 4.1 - Configure a New Issuer Group, from the **Parent group** drop down list and tick the checkboxes for **Use parent certificate**, **public and encryption keys** and **Use parent keys**

- You may skip the remaining fields or fill them, as appropriate
- Click the **Apply** button.

 **Note**

Cryptographic keys are created for encrypting the cardholder and transaction data of the specified issuer.

## Request and Update Issuer License

### ActiveAccess License

- Contact GPayments and request a license key for the issuer created in Section 4.2 - Configure an Issuer
- Copy the license key provided to you by GPayments to your clipboard.

#### System Management > Issuer Management

- Find the issuer and click the *Issuer Name*
- On the **Issuer Details** page, paste the copied **License Key** into the text box
- Click the **Apply** button.

 **Note**

If an error occurs, contact GPayments Tech Support.

## Configure the BIN

### System Management > Issuer Management

- Find the issuer and click the *Issuer Name*
- On the **Issuer Details** page, click the *BIN Management* link
- On the **BIN Management** page, click the *Add BIN* link
- On the **Add BIN** page, enter the **BIN** (e.g. 412345)
- Ensure **Status** is set to **Enabled**
- Select an option from the drop down list for **Device over 3-D Secure**, as appropriate

- Click the **Apply** button.

## Certificate Signing Requests

### Configure Issuer Group Signing Certificates

Issuer Group Signing Certificates should be configured individually for each provider.

#### Security > Issuer Certificate

- Click the *Create Certificate Request* link
- On the **Certificate Request** page
  - Select the **Issuer** or **Issuer Group** from the drop down list
  - Select the required **Provider** from the drop down list
  - Fill the remaining fields as appropriate
  - Click the **Apply** button.
- **Certificate Signing Request (CSR)** – Copy the contents of the CSR or click the **Download** button to save the CSR.

### Sign the Certificate Signing Request (CSR)

- Sign the Certificate Signing Request (CSR) using a Certificate Authority.

### Install the Certificate Request

#### Security > Issuer Certificate

- Click the *Install Certificate* link
- Select the **Issuer** or **Issuer Group** from the drop down list

- Select the required **Provider** from the drop down list (This must be the same as the provider selected for the Certificate Request in Section 5.1 - Configure Issuer Group Signing Certificates)
- Click the **Choose File** button to locate and select the **Signed Certificate** file or click the **Certificate content** radio button and paste the Signed Certificate content
- Click the **Apply** button
- Ensure that it is completed successfully.

# Configuration - from end of installation

## Configuration - ActiveAccess

The purpose of this section is to provide an overview of the steps required in order to configure the system for testing purposes. This requires you to set up at least one issuer, create test cards and upload the authentication and enrolment pages.

### Creating a New Issuer

- Login to the Administration server using an account with system admin access (such as administrator)
- Use the **Issuer Management** section and create an issuer. The system creates an issuer and displays a 19-digit Issuer ID. Make a note of the Issuer ID for future use.

#### Note

At this stage the new issuer is not registered.

- Send the Issuer ID and Issuer Name to GPayments and request an ActiveAccess license key. Once you receive the license key for the issuer, copy the contents of the license key into the **Issuer Details** page. Apply the changes and make sure that the message **License key is valid** is displayed.

The Administration server creates a set of cryptographic keys for the issuer in the HSM local to the administration server. If ActiveAccess is installed on a separate server, and as such uses its own hardware security module, these keys need to be transferred to that server's HSM.

- Export the following keys to the ActiveAccess HSM:

RSABV< Issuer\_ID >\_pub

RSABV< Issuer\_ID >\_pri

RSAMSC< Issuer\_ID >\_pub

RSAMSC< Issuer\_ID >\_pri

RSACB< Issuer\_ID >\_pub

RSAJCB< Issuer\_ID >\_pri

RSASK< Issuer\_ID >\_pub

RSASK< Issuer\_ID >\_pri

RSADC< Issuer\_ID >\_pub

RSADC< Issuer\_ID >\_pri

RSADEVICE< Issuer\_ID >\_pub

RSADEVICE< Issuer\_ID >\_pri

SPA< Issuer\_ID >

VbVA< Issuer\_ID >

VbVB< Issuer\_ID >

JCBA< Issuer\_ID >

JCBB< Issuer\_ID >

MSCA< Issuer\_ID >

MSCB< Issuer\_ID >

SKA< Issuer\_ID >

SKB<< Issuer\_ID >

DCA< Issuer\_ID >

DCB< Issuer\_ID >

Card< Issuer\_ID >

Where < Issuer\_ID > is the actual Issuer ID provided in the previous steps.

#### Info

For further information on key export and import, please see section 0 - Key Transfer.

#### Note

If you have enabled the **Use parent keys** option, the only key generated for the issuer is Card< Issuer\_ID >

- If the enrolment server or registration servers have been set-up on a different machine to administration server, these keys need to be transferred to their server HSM.

- Export the following keys to the enrolment or registration server HSM:

```
Card < Issuer_ID >
```

Where < Issuer\_ID > is the actual Issuer ID provided in the previous steps.

#### Info

For further information on key export and import, please see section 0 - Key Transfer.

- Use the Certificates Details section to create a certificate request for the issuer.

#### Note

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

- Send the certificate request to the appropriate Mastercard, Visa, JCB, American Express or Diners Club International certificate authority for signing.
- Import the signed certificate back to the system using the Certificates Details section (the certificate must be in p7b format and include all the certificates in the certification path)

#### Note

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

- Upload the issuer public key certificate using the Public & Encryption Key Management function in the administration server.

#### Note

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

- Upload the authentication and enrolment pages (if applicable) for the issuer using the Custom Pages function in the administration server.

## Creating a New Issuer Group

- Login to the Administration server using an account with system admin access (such as administrator)
- Use the **Group Management** section to create an issuer group.

Administration server creates a set of cryptographic keys for the issuer group in the HSM local to the administration server. If ActiveAccess is installed on a separate server, and as such uses its own hardware security module, these keys need to be transferred to that server's HSM.

- Export the following keys to the ActiveAccess HSM:

RSABV< Group\_ID >\_pub

RSABV< Group\_ID >\_pri

RSAMSC< Group\_ID >\_pub

RSAMSC< Group\_ID >\_pri

RSACB< Group\_ID >\_pub

RSACB< Group\_ID >\_pri

RSASK< Group\_ID >\_pub

RSASK< Group\_ID >\_pri

RSADC< Group\_ID >\_pub

RSADC< Group\_ID >\_pri

RSADVICE< Group\_ID >\_pub

RSADVICE< Group\_ID >\_pri

SPA< Group\_ID >

VbVA< Group\_ID >

VbVB< Group\_ID >

JCBA< Group\_ID >

JCBB< Group\_ID >

MSCA< Group\_ID >

MSCB< Group\_ID >

SKA< Group\_ID >

SKB< Group\_ID >

DCA< Group\_ID >

DCB< Group\_ID >

- Where < Group\_ID > is the group's unique identifier as displayed in the issuer group details page.

 **Note**

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

 **Info**

For further information on key export and import, please see section 0 - Key Transfer.

- Use the Certificate Details section to create a certificate request for the group.

 **Note**

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

- Send the certificate request to the appropriate Mastercard, Visa, JCB, American Express, or Diners Club International certificate authority for signing.

 **Note**

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

- Import the signed certificate back to the system using the Certificate Details section (the certificate must be in p7b format and include all the certificates in the certification path)

 **Note**

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

- Upload the group public key certificate using the Public & Encryption Key Management function in the administration server.

 **Note**

Skip this step if you have enabled the Use parent certificate, public and encryption keys option.

## Configuring an Issuer for ActiveDevice

To activate device authentication for an issuer:

- Login to the Administration server using an account with system admin access (such as administrator)
- Use **System Management > Issuer Management** to find issuer's account and access issuer details
- Install a license key with ActiveDevice functionality enabled. If an appropriate license key is installed the license status shows **Device authentication enabled**.

 **Note**

Contact GPayments if you don't have a license key with the ActiveDevice option enabled.

- Create and install an issuer signing certificate for ActiveDevice, make sure that the CA is in the ActiveDevice's trusted CA list (in ActiveAccess)
- Click on the ActiveDevice settings link. Select the appropriate token type for the issuer (e.g. VASCO) and apply the changes.
- Upload two-factor authentication pages customised for this issuer. Use **Issuer > Custom Pages > Upload File** to locate and upload the two-factor custom pages. If testing you can use the sample two-factor pages which can be found in the **/pkg/Custom Pages/Samples/** directory.

## Cards

Add a  
New Card

### Add a New Card

Users > New Card

- Select **Issuer** from the drop down list
- Select the **Authentication method** from the drop down list (This should correspond to the card provider)
- Ensure **Status** is set to **Enabled**
- Enter the **Card number**
- Enter the cardholder name in **Name on card**
- Enter the **Expiry date**
- Set the **Internet PIN**. This will be used during Activation During Shopping when registering the Pre-registered card)
- Click the **Apply** button.

#### Note

Cards can also be uploaded in bulk through ActiveAccess Registration Requests and the GPayments Card Loader application. Refer to the ActiveAccess documentation, ActiveAccess Administration and GPayments Card Loader and Signer/Verification Application, for further information.

## Configure Custom Pages

Upload Local  
Custom Pages

## Upload Local Custom Pages

Issuers > Custom Pages

- Select the **Issuer** or **Issuer Group** radio button and select from the drop down list
- If matches are found, custom pages have previously been set up for this issuer, in which case go to Section 8 - Authentication Scenarios Setup
- If no matches are found, click the *Upload File* link
- Use the **Choose File** button to locate and upload the *Authentication.zip* file from the following path in ActiveAccess installation package: ActiveAccess/data/custompage/issuer/Any Bank

### Note

You can customise the XSL pages as appropriate. Note that different custom pages are used for local and remote issuers.

- Click the **Apply** button.

## Authentication Scenarios Setup

Each authentication scenario covered in this section should be set up and tested independently, *using a newly created card*, as individual scenarios may require a different configuration within the same issuer.

### Activation During Shopping (ADS) Scenario

Configure Issuer  
Settings

### Configure Issuer Settings

Issuer > Settings

- Select the **Issuer** from the drop down list
- Set **Activation During Shopping** to **Enabled** for all requested/configured card providers

- Click the **Apply** button.

## Perform a Test Transaction

- Go to Section 9 - Perform a Test Transaction.

## Authentication Success Scenario

### Configure Issuer Settings

Issuer > Settings

- Select the **Issuer** from the drop down list
- Set **Activation During Shopping** to **Enabled** for all requested/configured card providers
- Click the **Apply** button.

### Register the Pre-Registered Card

Perform a test transaction with the card to register the card through Activation During Shopping (ADS). If you have access to the GPayments MPI (ActiveMerchant), follow the steps below.

ActiveMerchant Test Payment Page

- Go to the ActiveMerchant Test Payment page to register a newly created card set up in Section 6 - Configure Card Numbers
- Enter the **Card number** to perform a test transaction
- Click the **Submit** button
- On the confirmation page, click the **Submit** button
- On the registration page, enter **Name on Card** and **Internet Pin**, which were set up in Section 6 - Configure Card Numbers
- Click the **Submit / Activate** button
- Enter a **Personal Assurance Message**
- Set a **Password** to be used for authenticating the cardholder

- Click the **Submit** button
- On the next page, click the **Continue / OK** button to go to the Success page.

#### PERFORM A TEST TRANSACTION

- Go to Section 9 - Perform a Test Transaction.

## Authentication Fail Scenario

### Configure Issuer Settings

Issuer > Settings

- Select **Issuer** from the drop down list
- Set **Activation During Shopping** to **Enabled** for all requested/configured card providers
- Set an appropriate value for **Maximum unsuccessful attempts**. As the card will need to be locked for this scenario (Section 8.3.3 - Lock the Card), it is preferable to set a lower value, e.g. 3. Do not set the value to 0 (disable).
- Set **Automatic unlock** to 0 (disabled)

#### Note

Perform this step only if you would like the cards of this issuer to stay locked and provide results for the authentication failed scenario each time.

- Click the **Apply** button.

### Register the Pre-Registered Card

Perform a test transaction with the card, to register the card through Activation During Shopping (ADS). If you have access to the GPayments MPI (ActiveMerchant), follow the steps below.

## ActiveMerchant Test Payment Page

- Go to the ActiveMerchant Test Payment Page to register the card set up in Section 6 - Configure Card Numbers
- Enter the **Card number** to perform a test transaction
- Click the **Submit** button
- On the confirmation page, click the **Submit** button
- On the registration page, enter **Name on Card** and **Internet Pin** which were set in Section 6 - Configure Card Numbers
- Click the **Submit** button
- Enter a **Personal Assurance Message**
- Set a **Password** to be used for authenticating the cardholder
- Click the **Submit** button
- On the next page, click the **Continue / OK** button to go to the Success page.

## Lock the Card

To lock the card, perform a test transaction with the card, entering an incorrect password until the card is locked. If you have access to the GPayments MPI (ActiveMerchant), follow the steps below.

## ActiveMerchant Test Payment Page

- Go to the ActiveMerchant Test Payment page
- Enter the **Card number** to perform a test transaction
- Click the **Submit** button
- On the confirmation page, click the **Submit** button
- On the authentication page, enter an incorrect password. Repeat, until the message *This Account is Locked!* is displayed.
- Click the **OK** button.

## Perform a Test Transaction

- Go to Section 9 - Perform a Test Transaction.

## Forgot Password Scenario

### Configure Issuer Settings

System Management > Issuer Management

- Find the issuer and click the *Issuer Name* to go to the **Issuer Details** page
- Set **Show extended account information** to **Yes** for Question and Answer fields be shown on **Card Details** page
- Click the **Apply** button.

Issuer > Settings

- Select the **Issuer** from the drop down list
- Set **Activation During Shopping** to **Enabled** for all requested/configured card providers
- Click the **Apply** button.

### Register the Pre-Registered Card

To register the card through Activation During Shopping (ADS), perform a test transaction with the card. If you have access to the GPayments MPI (ActiveMerchant), follow the steps below.

ActiveMerchant Test Payment Page

- Go to the ActiveMerchant Test Payment page to register the card set up in Section 6 - Configure Card Numbers
- Enter the **Card number** to perform a test transaction
- Click the **Submit** button
- On the confirmation page, click the **Submit** button
- On the registration page, enter **Name on Card** and **Internet Pin** which were set in Section 6 - Configure Card Numbers
- Click the **Submit** button
- Enter a **Personal Assurance Message**

- Set a **Password** to be used for authenticating the cardholder
- Click the **Submit** button
- On the next page, click the **Continue / OK** button to go to the Success page.

### Configure Question & Answer

Users > Find Card > Card Details

- Enter a **Question** and an **Answer**
- Click the **Apply** button.

### Perform a Test Transaction

- Go to Section 9 - Perform a Test Transaction. During the transaction, click on the "Forgot your Password?" link.

## Proof of Attempt Scenario

### Configure Issuer Settings

Issuer > Settings

- Select **Issuer** from the drop down list
- Set **Activation During Shopping** to **Disabled** for all requested/configured card providers
- Set **Proof of Authentication Attempt** to **Enabled** for all requested/configured card providers
- Click the **Apply** button.

### Perform a Test Transaction

- Go to Section 9 - Perform a Test Transaction.

## PAN Not Enrolled Scenario

Configure Issuer  
Settings

### Configure Issuer Settings

Issuers > Settings

- Select **Issuer** from the drop down list
- Set **Activation During Shopping** to **Disabled** for all requested/configured card providers
- Set **Proof of Authentication Attempt** to **Disabled** for all requested/configured card providers
- Click the **Apply** button.

### Perform a Test Transaction

- Go to Section 9 - Perform a Test Transaction.

## Delay / Timeout Scenario

You can test scenarios such as delay or timeout in Verify Enrolment or Payer Authentication processes.

You can create a **responseTimeout.properties** file in ActiveAccess' **AA\_HOME** directory. This configuration file can be used for testing purposes only and under no circumstances should be used in a real production environment. The properties in this configuration file should be in the following general format:

- **BIN.reqType**=waiting time (milliseconds)
- **BIN**: is the issuer specified BIN number for which you would like to cause a delay in the response to card numbers that match the BIN.
- **reqType (VE or PA)**: is the type of the request for which you would like to cause a given amount of delay. VE and PA stand for Verify Enrolment and Payer Authentication requests respectively.
- **Waiting time**: The delay in milliseconds that you would like to cause in the response of VE or PA requests.

To set a VE response delay, it is recommended that it is greater than the VERES time-out defined by the MPI.

To set PA response delay, it is recommended that it is greater than the PAREs time-out defined by the MPI

 **Info**

0 means unlimited

 **Example**

412345.VE=15000

512345.PA=20000

341234.VE=0

ActiveAccess server should be restarted for changes to take effect.

## Perform a Test Transaction

 Test Transaction

After configuring each of the authentication scenarios, perform a test transaction with the card. If you have access to the GPayments MPI (ActiveMerchant), follow the steps below.

### ActiveMerchant Test Payment Page (3-D Secure 1)

- Go to the ActiveMerchant Test Payment page
- Enter the **Card number** to perform a test transaction
- Click the **Submit** button
- Ensure that the outcome corresponds with the authentication scenario.

## Devices

This section covers the configuration of licenses and BINs to enable the use of devices for authentication. Examples of some common devices have been included below.

Note that when device configuration is complete, devices can be assigned to individual cards during transactions or via ActiveAccess Administration in Users > Find Cards > Card Details > Assigned Devices > Device Management.

### Configure License and BINs

#### Request and Update License

For issuers to be device compatible, a license needs to be issued with ActiveDevice support.

##### ActiveAccess License

- Contact GPayments and request for a license key with ActiveDevice support for the issuer
- Copy the license key provided to you by GPayments to your clipboard

##### System Management > Issuer Management

- Find the issuer and click the *Issuer Name*
- On the **Issuer Details** page, paste the copied **License Key** into the text box
- Click the **Apply** button.

#### Note

If an error occurs, contact GPayments Tech Support.

## Enable Device over 3-D Secure for BINs

System Management > Issuer Management > Issuer Details > BIN Management

- If the BIN has been created previously and has **Device over 3-D Secure** set to **Disabled**, follow the steps below:
  - Click on the *BIN* to go to the **BIN Details** page
  - Set **Device over 3-D Secure** to **Enabled**
  - Click the **Apply** button.
- If new BINs are being created, follow the steps below:
  - Click the *Add BIN* link
  - On the **Add BIN** page, enter the **BIN** (e.g. 412345)
  - Ensure **Status** is set to **Enabled**
  - Set **Device over 3-D Secure** to **Enabled**
  - Click the **Apply** button.

## SMS

### Set up a New SMS Centre

System Management > Device Management > Edit Default Device Parameters > Device Type: SMS > SMS Centres > New SMS Centre

- Enter a **Name** for the SMS centre
- Enter the **Domain/IP** of the SMS centre
- Enter the **Port** number of the SMS centre
- Enter **System ID**, **System type** and **Password**, if required
- Enter **Sender's mobile number**
- Click the **Apply** button.

## Add SMS in ActiveDevice Settings

System Management > Issuer Management > Issuer Details > ActiveDevice Settings

- Under **Supported devices**, in the **Available** box, select SMS and click the **Add >>** button.
- Click the **Apply** button.

## Edit Default Device Parameters

System Management > Device Management > Edit Default Device Parameters

- Select **SMS** from the **Device type** drop down list
- Update the device parameters as appropriate
- Click the **Apply** button.

## Email

## Add Email in ActiveDevice Settings

System Management > Issuer Management > Issuer Details > ActiveDevice Settings

- Under **Supported devices**, in the **Available** box, select Email and click the **Add >>** button.
- Click the **Apply** button.

## Edit Device Parameters

System Management > Issuer Management > Issuer Details > ActiveDevice Settings > Device parameters

- Select **Email** from the **Device type** drop down list
- Untick **Use device's default parameters**
- Update the device parameters as appropriate
- Click the **Apply** button.

## Set up Email Templates

System Management > Issuer Management > Issuer Details > ActiveDevice Settings > Device parameters > Device Type: Email > Email Templates

- Select a **Template name** from the drop down list
- Adjust the template as required using the **Template** textbox and check the **Preview** textbox for **Plain Context type** or click *Send Test Email* for **HTML Context type**.
- Click the **Apply** button.

### Note

The settings and templates configured in **10.3.2 Edit Device Parameters** and **10.3.3 Set up Email Templates** will apply to the specific issuer only. To set default device parameters and templates that apply to all issuers, go to **System Management > Device Management > Edit Default Device Parameters**. The default configurations will apply to all issuers, unless **Use device's default parameters** is unticked in the issuer's device configurations.

## VASCO

## Upload the VASCO File

System Management > Device Management > Upload File

- Select the Issuer from the **Issuer** drop down list
- Select **VASCO** from the **Device type** drop down list
- Click the **Choose File** button to locate and select the appropriate VASCO file
- Enter the **Key value**
- Set up a **Schedule** as required
- Click the **Apply** button.

# Remote/External Authentication

- Before commencing remote authentication setup, make sure that the required Web services have been implemented and that the CAAS server is up and running.

## Update Remote ACS Settings

System Management > ACS Settings > Authentication server: Remote (CAAS)

- Enter the **ACS URL** (e.g. <https://yourserverip:port/acs/pa>)
- Click the **Apply** button.

## Configure CAAS Client Certificate

Security > CAAS Certificate

- Click the *Create Certificate Request* link
- On the **CAAS Certificate Request** page:
  - Enter the certificate details, as appropriate
  - Click the **Apply** button.
- Certificate Request – Copy the certificate contents or click the **Download** button to save the certificate request.

## Sign Certificate Request

- Sign the Certificate Request using a Certificate Authority.

## Install Certificate Request

Security > CAAS Certificate

- Click the *Install Certificate* link
- Use the **Choose File** button to locate and select the **Signed Certificate** file or click the **Certificate content** radio button and paste the Signed Certificate content.
- Click the **Apply** button.

## Upload CAAS CA Certificate

Security > CA Certificate

- Click the *Import CA Certificate* link
- Select **CAAS client** from the **Provider** drop down list
- Click the **Choose File** button to locate and select the **CA Certificate** file
- Click the **Import** button.

## Configure CAAS Server

Servers > CAAS Servers

- Click the *Add CAAS Server* link
- On the **Add CAAS Server** page:
  - Enter **CAAS URL** of the CAAS server
  - Enter a value for **CAAS Connection timeout**
  - Enter a value for **Maximum SMS request**
  - Fill the remaining fields as appropriate
  - Click the **Add** button.

## Check CAAS Status

Servers > CAAS Servers

- Click the *CAAS URL* link
- On the **Edit CAAS Server** page, click the *Check CAAS Status* link

- On the **Check CAAS Status** page, ensure the message displayed indicates that CAAS is up and running.

## Configure Remote Issuer

System Management > Issuer Management

- Find the issuer and click the *Issuer Name*
- If the issuer does not exist, refer to Section 4 - Issuer Group and Issuer Setup to configure issuer, license and BIN and then continue with the next step, otherwise click the *Issuer Name* link
- On the **Issuer Details** page:
  - Set **Authentication server** to **Remote (CAAS)**
  - Select the URL of the **CAAS Server** from the drop down list
  - Click the **Apply** button.

## Upload Remote Custom Pages

Issuers > Custom Pages

- Select the **Issuer** or **Group** radio button and select from the drop down list
- Click the *Upload File* link
- Use the **Choose File** button to locate and upload the *Authentication.zip* file from the following path in ActiveAccess installation package: ActiveAccess/data/custompage/issuer/AnyBank\_Remote

### Note

You can customise the XSL pages as appropriate. Note that custom pages are different for local and remote issuers.

- Click the **Apply** button.

# Database Archiving

## Prepare Archive Database

- Create a new database user with the appropriate permissions
- Connect to the database user and run *archive\_schema.sql* from the **Archive** folder in ActiveAccess installation package.
- To give access to the current ActiveAccess database user
- In the *archive\_grant.sql* from the **Archive** folder in ActiveAccess installation package, replace the tags < **archiveusername** > with the newly created database user for archiving, < **dbname** > with the database owner name, and < **dbuser** > with the database user name that accesses the database. In a simple configuration the database user name may be the same as the database owner name.

### Note

The < dbname > and < dbuser > can be found in Tomcat\_Home\bin\config\acsconfig.properties as **DBNAME** and **DBUSERNAME** respectively.

- Run the updated **archive\_grant.sql** with a sys/system connection.

## Schedule Archiving

### System Management > Archive Management

- Click the *Edit* link
- Tick the **Automatic archive** checkbox to enable automatic archiving
- Fill the remaining fields as appropriate

- For purging the archived data:
  - Tick the **Automatic archive purge** checkbox to enable automatic archiving
  - Fill the remaining fields as appropriate
- Click the **Apply** button.

## Configure Archiving

System Management > Archive Management > Archive Databases > New Archive Database

- Enter the **Archive Database link** or **Database user**
- Click the **Apply** button.

## Set Default Archive Database for Search

System Management > Archive Management > Archive Databases

- If you only have one archive database configured, it will automatically be set as the default for search. If you have more than one archive database configured, click the *Set as default for search* link for the desired archive database.

## Set Default Archive Server

Servers > MIA Servers

- Click the *Set as default archive server* link for the desired MIA Server.

## Check Archive/Purge History

System Management > Archive Management > Archive Databases

- Click the *Archive database* link to go to the **Archive Database Details** page

A list of archive and purge history reports will appear under **Archive History** and **Purge History** tabs

# Error Codes

## Server Error Codes

| Server Error Codes |                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |

| <b>2-F Authentication</b> |             | A generic functionality, which allows for strong authentication of any transaction, commercial or otherwise, for example, strong authentication of users when they login to an Internet banking site or when they authorise funds transfer to a third party. 2-F authentication requires two independent ways to establish identity and privileges as opposed to traditional password authentication, which requires only one 'factor' (knowledge of a password).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>3-D Secure</b>         | <b>3DS</b>  | A payer authentication standard (3D Secure 1 (3DS1)) introduced by Visa (Verified by Visa) and subsequently adopted by Mastercard (Mastercard SecureCode and Mastercard SecureCode), JCB (JCB J/Secure), American Express (SafeKey) and Diners Club International / Discover (ProtectBuy) designed to reduce online credit card fraud and chargeback. The 3DS standard provides an additional layer of protection in card-not-present credit card transactions for the three domains involved: Issuer domain of the card issuing bank, the Interoperability domain of the card scheme's infrastructure and the Acquirer domain of the merchants.<br><br>The second version of the standard, 3D Secure 2 (3DS2) (EMV 3-D Secure protocol), is facilitated by EMVCo, a six member consortium comprised of American Express, Discover, JCB, Mastercard, UnionPay and Visa. It creates a frictionless payment experience for cardholders by facilitating a richer cardholder data exchange, allowing risk-based authentication by issuers for low risk transactions, instead of authentication challenges to the cardholder, such that most authentication activity will be invisible to the cardholder. 3DS2 also supports authentication of app-based transactions on mobile and other consumer connected devices, and cardholder verification for non-payment transactions, such as adding a payment card to a digital wallet. |
| <b>3D Secure</b>          | <b>3DS1</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>3D Secure 1</b>        | <b>3DS2</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>3D Secure 2</b>        |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Term                                                | Acronym        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>3DS Client</b>                                   |                | The consumer-facing component, such as a browser-based or mobile app online shopping site, which facilitates consumer interaction with the 3DS Requestor for initiation of the EMV 3-D Secure protocol.                                                                                                                                                                                                                                      |
| <b>3DS Integrator</b>                               |                | An EMV 3-D Secure participant that facilitates and integrates the 3DS Requestor Environment, and optionally facilitates integration between the Merchant and the Acquirer.                                                                                                                                                                                                                                                                   |
| <b>3-D Secure Provider</b>                          |                | An entity such as American Express, Diners Club International, Discover, JCB, Mastercard or Visa, which provides interoperability services for issuers and merchants who participate in the authentication process. The 3-D Secure provider is normally in charge of managing the directory server, managing the authentication history server and issuing the digital certificates required for participation in the authentication scheme. |
| <b>3DS Requestor</b>                                |                | The initiator of the EMV 3-D Secure Authentication Request, known as the AReq message. For example, this may be a merchant or a digital wallet requesting authentication within a purchase flow.                                                                                                                                                                                                                                             |
| <b>3DS Requestor App</b>                            |                | An App on a Consumer Device that can process a 3-D Secure transaction through the use of a 3DS SDK. The 3DS Requestor App is enabled through integration with the 3DS SDK.                                                                                                                                                                                                                                                                   |
| <b>3DS Requestor Environment</b>                    |                | This describes the 3DS Requestor controlled components of the Merchant / Acquirer domain, which are typically facilitated by the 3DS Integrator. These components include the 3DS Requestor App, 3DS SDK, and 3DS Server. Implementation of the 3DS Requestor Environment will vary as defined by the 3DS Integrator.                                                                                                                        |
| <b>Three Domain Secure Software Development Kit</b> | <b>3DS SDK</b> | 3-D Secure Software Development Kit. A component that is incorporated into the 3DS Requestor App. The 3DS SDK performs functions related to 3-D Secure on behalf of the 3DS Server.                                                                                                                                                                                                                                                          |
| <b>3DS Requestor Initiated</b>                      | <b>3RI</b>     | 3-D Secure transaction initiated by the 3DS Requestor for the purpose of confirming an account is still valid. The main use case being recurrent transactions (TV subscriptions, utility bill payments, etc.) where the merchant wants perform a Non-Payment transaction to verify that a subscription user still has a valid form of payment.                                                                                               |
| <b>3DS Server</b>                                   |                | Refers to the 3DS Integrator's server or systems that handle online transactions and facilitate communication between the 3DS Requestor and the Directory Server.                                                                                                                                                                                                                                                                            |

| Term                                      | Acronym     | Definition                                                                                                                                                                                                                                            |
|-------------------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>3-D Secure</b>                         | <b>3DS</b>  | <b>Three Domain Secure.</b> An eCommerce authentication protocol that for version 2 onwards enables the secure processing of payment, non-payment and account confirmation card transactions.                                                         |
| <b>Access Control Server</b>              | <b>ACS</b>  | A component that operates in the Issuer Domain, which verifies whether authentication is available for a card number and device type, and authenticates specific Cardholders.                                                                         |
| <b>Accountholder Authentication Value</b> | <b>AAV</b>  | A value providing proof of cardholder authentication, which is generated by the issuer's access control server for each transaction. The AAV is passed by the merchant to the acquirer and then by the acquirer to the issuer through the UCAF field. |
| <b>Acquirer</b>                           |             | A financial institution that has a relationship with a merchant and processes payment transactions for that merchant.                                                                                                                                 |
| <b>ActiveAccess</b>                       |             | GPayments' access control server for card issuers and service providers.                                                                                                                                                                              |
| <b>ActiveDevice</b>                       |             | GPayments' device agnostic two-factor authentication component.                                                                                                                                                                                       |
| <b>ActiveMerchant</b>                     |             | GPayments' payment authentication platform (merchant plug-in) for merchants.                                                                                                                                                                          |
| <b>ActiveServer</b>                       |             | GPayments' 3DS Server for payment processors and merchants (see <i>3DS Server</i> ).                                                                                                                                                                  |
| <b>Attempts</b>                           |             | Used in the EMV 3DS specification to indicate the process by which proof of an authentication attempt is generated when payment authentication is not available. Support for Attempts is determined by each DS.                                       |
| <b>Authentication</b>                     |             | In the context of 3-D Secure, the process of confirming that the person making an eCommerce transaction is entitled to use the payment card.                                                                                                          |
| <b>Authentication Device</b>              |             | A physical device capable of generating a token to be used in the verification of a user's identity.                                                                                                                                                  |
| <b>Authentication Request Message</b>     | <b>AReq</b> | An EMV 3-D Secure message sent by the 3DS Server, via the DS, to the ACS to initiate the authentication process.                                                                                                                                      |

| Term                                   | Acronym     | Definition                                                                                                                                                                                                                             |
|----------------------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication Response Message</b> | <b>ARes</b> | An EMV 3-D Secure message returned by the ACS, via the DS, in response to an Authentication Request message.                                                                                                                           |
| <b>Authentication Token</b>            |             | An unpredictable piece of information generated by an authentication device, which is used to verify the identity of a user. The term token may sometimes be used to refer to the physical device that generated the token as well.    |
| <b>Authentication Value</b>            | <b>AV</b>   | A cryptographic value generated by the ACS to provide a way, during authorisation processing, for the authorisation system to validate the integrity of the authentication result. The AV algorithm is defined by each Payment System. |
| <b>Authorisation</b>                   |             | A process by which an Issuer, or a processor on the Issuer's behalf, approves a transaction for payment.                                                                                                                               |
| <b>Authorisation System</b>            |             | The systems and services through which a Payment System delivers online financial processing, authorisation, clearing, and settlement services to Issuers and Acquirers.                                                               |
| <b>Bank Identification Number</b>      | <b>BIN</b>  | The first six digits of a payment card account number that uniquely identifies the issuing financial institution. Also referred to as an Issuer Identification Number (IIN) in ISO 7812.                                               |
| <b>BankNet</b>                         |             | Mastercard's proprietary payment network.                                                                                                                                                                                              |
| <b>Base64</b>                          |             | Encoding applied to the Authentication Value data element as defined in RFC 2045.                                                                                                                                                      |
| <b>Base64 URL</b>                      |             | Encoding applied to the 3DS Method Data, Device Information and the CReq/CRes messages as defined in RFC 7515.                                                                                                                         |
| <b>Card</b>                            |             | Card is synonymous with the account of a payment card, in the <i>EMV 3-D Secure Protocol and Core Functions Specification</i> .                                                                                                        |
| <b>Certificate Authority</b>           | <b>CA</b>   |                                                                                                                                                                                                                                        |
| <b>Cardholder</b>                      |             | An individual to whom a card is issued or who is authorised to use that card.                                                                                                                                                          |

| Term                                                        | Acronym     | Definition                                                                                                                                                                                                                           |
|-------------------------------------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cardholder Activation During Shopping</b>                |             | A 3D-Secure 1 process by which cardholders can enrol with the authentication system at the time of making a purchase at a participating merchant eCommerce website.                                                                  |
| <b>Centralised Authentication and Authorisation Service</b> | <b>CAAS</b> | A remote ACS, see <i>Access Control Server</i> .                                                                                                                                                                                     |
| <b>Challenge</b>                                            |             | The process where the ACS is in communication with the 3DS Client to obtain additional information through Cardholder interaction.                                                                                                   |
| <b>Challenge Flow</b>                                       |             | A 3-D Secure flow that involves Cardholder interaction as defined in the <i>EMV 3-D Secure Protocol and Core Functions Specification</i> .                                                                                           |
| <b>Challenge Request Message</b>                            | <b>CReq</b> | An EMV 3-D Secure message sent by the 3DS SDK or 3DS Server where additional information is sent from the Cardholder to the ACS to support the authentication process.                                                               |
| <b>Challenge Response Message</b>                           | <b>CRes</b> | The ACS response to the CReq message. It can indicate the result of the Cardholder authentication or, in the case of an App-based model, also signal that further Cardholder interaction is required to complete the authentication. |
| <b>Chip Card</b>                                            |             | A card with an on-board integrated circuit chip.                                                                                                                                                                                     |
| <b>Consumer Device</b>                                      |             | Device used by a Cardholder such as a smartphone, laptop, or tablet that the Cardholder uses to conduct payment activities including authentication and purchase.                                                                    |
| <b>Cryptography</b>                                         |             | A process that encrypts information for the purpose of protecting it. Information is decrypted when required.                                                                                                                        |
| <b>Device</b>                                               |             | see <i>Authentication Device</i> .                                                                                                                                                                                                   |
| <b>Device Channel</b>                                       |             | Indicates the channel from which the transaction originated. Either: • App-based (01-APP) • Browser-based (02-BRW) • 3DS Requestor Initiated (03-3RI)                                                                                |
| <b>Device Information</b>                                   |             | Data provided by the Consumer Device that is used in the authentication process.                                                                                                                                                     |

| Term                                           | Acronym               | Definition                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Directory Server</b>                        | <b>DS</b>             | A server component operated in the Interoperability Domain; it performs a number of functions that include: authenticating the 3DS Server, routing messages between the 3DS Server and the ACS, and validating the 3DS Server, the 3DS SDK, and the 3DS Requestor.                                          |
| <b>Directory Server Certificate Authority</b>  | <b>DS CA or CA DS</b> | A component that operates in the Interoperability Domain; generates and Certificate Authority (DS distributes selected digital certificates to components participating in 3-D Secure. Typically, the Payment System to which the DS is connected operates the CA.                                          |
| <b>Directory Server ID (directoryServerID)</b> |                       | Registered Application Provider Identifier (RID) that is unique to the Payment System. RIDs are defined by the ISO 7816-5 standard.                                                                                                                                                                         |
| <b>Electronic Commerce Indicator</b>           | <b>ECI</b>            | Payment System-specific value provided by the ACS to indicate the results of the attempt to authenticate the Cardholder.                                                                                                                                                                                    |
| <b>Digital Signature</b>                       |                       | Equivalent of the physical signature in the digital world. Digital signatures can verify the identity of owner of a piece of information or a document in the digital world.                                                                                                                                |
| <b>Enrolment</b>                               |                       | A cardholder must pass an initial online authentication procedure in 3D-Secure 1, which is verified by the Issuer prior to gaining eligibility for participation in American Express SafeKey, Diners Club International ProtectBuy, JCB J/Secure, Mastercard SecureCode or Verified by Visa authentication. |
| <b>Frictionless</b>                            |                       | Used to describe the authentication process when it is achieved without Cardholder interaction.                                                                                                                                                                                                             |
| <b>Frictionless Flow</b>                       |                       | A 3-D Secure flow that does not involve Cardholder interaction as defined in EMVCo Core Spec Section 2.5.1.                                                                                                                                                                                                 |
| <b>Issuer</b>                                  |                       | A financial institution that provides cardholders with credit cards.                                                                                                                                                                                                                                        |
| <b>J/Secure</b>                                |                       | JCB's standard for cardholder authentication, based on 3-D Secure.                                                                                                                                                                                                                                          |
| <b>Message Authentication Code</b>             | <b>MAC</b>            |                                                                                                                                                                                                                                                                                                             |

| Term                                          | Acronym      | Definition                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mastercard SecureCode / Identity Check</b> |              | Mastercard's payer authentication brand, which includes SPA Algorithm for the Mastercard Implementation of 3-D Secure, SPA and chip card authentication program (CAP).                                                                                                                                                                     |
| <b>Mastercard 3-D Secure</b>                  |              | The SPA Algorithm for the Mastercard Implementation of 3-D Secure that provides a browser authentication experience to the cardholder (see also <i>3-D Secure</i> ).                                                                                                                                                                       |
| <b>Mastercard Identity Check</b>              |              | see <i>Mastercard SecureCode / Identity Check</i> .                                                                                                                                                                                                                                                                                        |
| <b>Merchant</b>                               |              | Entity that contracts with an Acquirer to accept payments made using payment cards. Merchants manage the Cardholder online shopping experience by obtaining the card number and then transfers control to the 3DS Server, which conducts payment authentication.                                                                           |
| <b>Merchant Plug-in (MPI)</b>                 |              | A software module which can be integrated into a merchant's eCommerce website or run as a managed service on behalf of a number of merchants to provide 3-D Secure authentication.                                                                                                                                                         |
| <b>Non-Payment Authentication</b>             | <b>NPA</b>   | .                                                                                                                                                                                                                                                                                                                                          |
| <b>One-Time Passcode</b>                      | <b>OTP</b>   | A passcode that is valid for one login session or transaction only, on a computer system or other digital device.                                                                                                                                                                                                                          |
| <b>Out-of-Band</b>                            | <b>OOB</b>   | A Challenge activity that is completed outside of, but in parallel to, the 3-D Secure flow. The final Challenge Request is not used to carry the data to be checked by the ACS but signals only that the authentication has been completed. ACS authentication methods or implementations are not defined by the 3-D Secure specification. |
| <b>Payer Authentication Request</b>           | <b>PAReq</b> | Message sent from the MPI to the Access Control Server at the cardholder's issuer via the cardholder browser.                                                                                                                                                                                                                              |
| <b>Payer Authentication Response</b>          | <b>PARes</b> | A digitally signed message sent from the Access Control Server to the Merchant Plug-in which communicates whether the cardholder authentication was successful or not.                                                                                                                                                                     |

| Term                                              | Acronym     | Definition                                                                                                                                                                                                                                    |
|---------------------------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Payment Gateway</b>                            |             | A software system provided by an acquirer or a third party which accepts transactions from the Internet and transfers them to a payment network such as BankNet or VisaNet.                                                                   |
| <b>Preparation Request Message</b>                | <b>PReq</b> | 3-D Secure message sent from the 3DS Server to the DS to request the ACS and DS Protocol Versions that correspond to the DS card ranges as well as an optional 3DS Method URL to update the 3DS Server's internal storage information.        |
| <b>Preparation Response Message</b>               | <b>PRes</b> | Response to the PReq message that contains the DS Card Ranges, active Protocol Versions for the ACS and DS and 3DS Method URL so that updates can be made to the 3DS Server's internal storage.                                               |
| <b>Proof or authentication attempt</b>            |             | Refer to Attempts.                                                                                                                                                                                                                            |
| <b>ProtectBuy</b>                                 |             | Diners Club International and Discover standard for cardholder authentication, based on 3-D Secure.                                                                                                                                           |
| <b>Registered Application Provider Identifier</b> | <b>RID</b>  | Registered Application Provider Identifier (RID) is unique to a Payment System. RIDs are defined by the ISO 7816-5 Standard and are issued by the ISO/IEC 7816-5 Registration Authority. RIDs are 5 bytes.                                    |
| <b>Results Request Message</b>                    | <b>RReq</b> | Message sent by the ACS via the DS to transmit the results of the authentication transaction to the 3DS Server.                                                                                                                               |
| <b>Results Response Message</b>                   | <b>RRes</b> | Message sent by the 3DS Server to the ACS via the DS to acknowledge receipt of the Results Request message.                                                                                                                                   |
| <b>Risk-Based Authentication</b>                  | <b>RBA</b>  | During risk-based authentication, the rich cardholder data exchanged in AReq is taken into account to determine the risk profile associated with that transaction. The complexity of the challenge is then decided based on the risk profile. |
| <b>SafeKey</b>                                    |             | American Express standard for cardholder authentication, based on 3-D Secure.                                                                                                                                                                 |

| Term                                                    | Acronym    | Definition                                                                                                                                                                                                                             |
|---------------------------------------------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secure Payment Application (SPA)</b>                 |            | Mastercard's payer authentication standard designed to reduce online credit card fraud and chargeback using a client-side applet. Also known as Mastercard's PC Authentication Program, Mastercard SecureCode, Mastercard SPA and SPA. |
| <b>Secure Sockets Layer (SSL)</b>                       |            | A protocol designed to maintain the integrity and confidentiality of communication over the Internet.                                                                                                                                  |
| <b>SecureCode</b>                                       |            | see <i>Mastercard SecureCode / Identity Check</i> .                                                                                                                                                                                    |
| <b>Token:</b>                                           |            | see <i>Authentication Token</i> .                                                                                                                                                                                                      |
| <b>Two Factor Authentication</b>                        |            | see <i>2-F Authentication</i>                                                                                                                                                                                                          |
| <b>Uniform Resource Locator (URL)</b>                   |            | Address system for locating unique sites on the Internet.                                                                                                                                                                              |
| <b>Universal Cardholder Authentication Field (UCAF)</b> |            | Data element 48 sub element 43 as defined in Mastercard BankNet to carry authentication data. Mastercard SecureCode uses this element to transport AAV from the acquirer to the issuer.                                                |
| <b>Verified by Visa</b>                                 | <b>VbV</b> | A payer authentication standard introduced by Visa (see <i>3-D Secure</i> ).                                                                                                                                                           |
| <b>VisaNet</b>                                          |            | Visa's proprietary payment network.                                                                                                                                                                                                    |
| <b>Visa Secure</b>                                      |            | A program developed by Visa to make online payments more secure through 3-D Secure 2.                                                                                                                                                  |

## Out of Band (OOB) Authentication Adapter (Specifications)

- + Added samples to [Get OOB Adapter Information](#) and [Request OOB Challenge](#)
- + Added new **Length** for `acctNumber` in [TransactionInfo Data Elements](#) and `cardholderName` in [CardHolderInfo Data Elements](#)
- + Added **Message Inclusion** for `clientId` and `deviceId` in [AdditionalInfo Elements](#).

## Risk Engine Adapter (Specifications)

- + Added [AReqWithTransStatus Data Elements](#)
- + Added new **Length** for `acctNumber` and `cardholderName` in [AReq Data Elements](#)
- + Added **Message Inclusion** for `clientId` in [AdditionalInfo Data Elements](#)

24/04/2020

8.2.3

8.2.3:1

## Risk Engine Adapter (Specifications)

- Δ Changes made to [Parameter Data Elements](#)
- Δ Change made to [Condition Data Elements](#)
- + Added [ValueType Data Elements](#), [ConditionAssessor Data Elements](#), and [TxCallback Data Elements](#)
- Δ Changes made to [ConditionValue Data Elements](#)
- + Added [Range Data Elements](#)
- Δ Change made to [messageExtension Data Elements](#)
- ✗ Removed [AdapterRiskAssessmentOutput Data Elements](#).

17/4/2020

8.2.0

8.2.0:2

## Remote Messaging (Specifications)

- + Added attribute lengths to the **Usage** column of [Table 2 - VerifyRegReq, T](#), [Table 4 - Transaction](#) and [Table 14 - InitAuthReq](#).

## Out of Band (OOB) Authentication Adapter (Specifications)

- Δ Changes made to [Out of Band \(OOB\) Authentication Adapter \(Specifications\)](#)

28/02/2020

8.2.0

8.2.0:1

## Installation (Installation Guide)

- + Added **TOMCAT\_KEYSTORE**, **TOMCAT\_KEYSTORE\_PASS**, **TOMCAT\_TRUSTSTORE** and **TOMCAT\_TRUSTSTORE\_PASS** to [configuration](#)

## Issuer Management (Admin UI)

- + Added **IAV generation algorithm** to [Issuer Details](#).

## Risk Management (Admin UI)

- Δ Change made to **Score range for device** in [Add / Edit Risk Chain](#).

|------|--------|---------|----------------|

## Servers (Admin UI)

- + Added **OOB info template** to [Edit CAAS Server](#).

## Issuers (Admin UI)

- + Added **Maximum interaction** to [Remote Settings](#).

## Cards (Admin UI)

- + Added **Client ID** to [Find Card](#) and [Card Details](#)
- + Added note to **Expiry date** in [New Card](#) and [Card Details](#).

## Transactions (Admin UI)

- + Added **Client ID** to [Find 3-D Secure](#)
- + Added **Risk decision** and **Client ID** to [Transaction Details](#).

## Local Messaging (Specifications)

- + Δ Additions & changes made for **Client ID** to:
  - Δ [Sample pre-registration request](#)
  - Δ [Sample final registration request for traditional 3-D Secure](#)
  - Δ [Sample final registration request for two-factor authentication over 3-D S](#)
  - Δ [Sample update registration request](#)
  - + [Card Device Update Request](#)
  - Δ [Sample Registration Notification](#)
  - Δ [Sample Device Update Notification](#)
  - Δ [Sample Opt-Out Notification](#)
  - Δ [Sample Lock Notification](#)
  - Δ [Cardholder Registration DTD](#).

## Remote Messaging (Specifications)

- + Added **LanCode** to [Table 3 - Card](#) and [Table 6 - CardInfo](#)
- + Added **twoFA** to [Table 6 - CardInfo](#).

| Date | AA Ver | Doc Ver | Change Details |
|------|--------|---------|----------------|
|------|--------|---------|----------------|

## Local Messaging (Specifications)

- △ Change made to [Request](#): Update EncVectorIV
- △ Update Sample final registration request for [traditional 3-D Secure](#)
- △ Change made to [Cancel Registration Request](#): Make name attribute of ca optional
- △ Change made to [Critical Card Data Encryption and Decryption](#): Change ke algorithm to AES
- △ Change made to [Cardholder Registration DTD](#): Change Name CDATA to I

## Out of Band (OOB) Authentication Adapter (Specifications)

- + Added Swagger API URL to [Restful API version of OOB Adapter](#).

## Risk Engine Adapter (Specifications)

- + Added Swagger API URL to [RESTful API Risk Adapter](#).

## Error Codes

- + Added Error codes to [Server Error Codes](#).

15/11/2019 8.1.0 8.1.0:1

## Installation (Installation Guide)

- ✗ Removed HSM\_LIB\_DIR parameter from [Upgrades to v8.x.x](#).

## System Management (Admin UI)

- △ Change made to [New Issuer Group](#), [Issuer Group Details](#), and [Issuer Data](#) Changes MAC Algorithm to **3DS1 only** and changed Use parent certificate [public and](#) encryption keys.
- △ Change made to [Public & Encryption Key Management](#): Change key algorithm to AES.

## Security (Admin UI)

- + New section added: [SDK certificate](#).

## Cards (Admin UI)

- △ Change made to [New Card](#): The card Expiry date is mandatory for Master

## Risk Engine Adapter (Specifications)

- ✗ One method of TxCallback removed from [Parameter Data Elements](#).
- ✗ resultWhenTransmissionError removed from [RemoteCondition Data Elements](#)
- + range field added into [ConditionValue Data Elements](#)

| Date | AA Ver | Doc Ver | Change Details |
|------|--------|---------|----------------|
|------|--------|---------|----------------|

## Security (Admin UI)

- + **Directory Server Certificate** section added
- + **OOB Certificate** section added
- + **Risk Certificate** section added.

## Issuers (Admin UI)

- Δ **Providers** parameters moved to a new page, and linked, from the **Settings** page. New fields added.

## Rules (Admin UI)

- Δ **Rule Management** section replaces previous **Authentication Exemption** and **Registration** sections
- Tabs for:
  - + **Registration** previously **Force Registration** tab under **Rules**
  - Δ **Authentication** previously **Authentication Exemption** tab under **Rules**
  - + **Settings**.

## Cards (Admin UI)

- Δ **Users** tab renamed to **Cards**.

## Reports (Admin UI)

- Δ Reports support reporting by 3-D Secure version.

## Transactions (Admin UI)

- Δ **Find 3-D Secure**: supports search by 3-D Secure version. New fields added.

## Admins (Admin UI)

- Δ **Admin User Details** and **User Profile**: added **2-factor authentication** login

## Local Messaging (Specifications)

- Δ **Final Registration Request**: updated with OOB device registration request

## Remote Messaging (Specifications)

- Δ **Transaction** table: **issuerName** and **theeDSPProtocolVersion** added
- + **HeaderParams** table added
- + **AdditionalParams** table added
- + **PreAuthResp** table: **AuthType** added
- + **InitAuthReq** table: new OTP types for **AuthType** and **oobInfo** added
- Δ **Sample Request Response**: changed **CVD** to NULL.

## CHANGES TO DOCUMENTATION STRUCTURE

 All documentation moved online with the ability to print to PDF

**To print the entire ActiveAccess documentation:** click the  button on the [Introduction](#) page.

**To print a section:** click the  button on that section.

**Tip:** hovering your mouse over the  button will let you see which section was printed.

 See [Documentation change details](#) for full details of the changes in the documentation moving from PDF to online format.

# Release Notes

## ActiveAccess v8.3.0

[29/05/2020]

[EOL: Two years after the subsequent version's release date]

| Type        | Issue Number | Description                                                                | Components                                          |
|-------------|--------------|----------------------------------------------------------------------------|-----------------------------------------------------|
| ENHANCEMENT | #158         | OTP & password option for OOB                                              | Issuer Administration, Access Control Server        |
| ENHANCEMENT | #274         | Encrypting critical data such as cardnumber in adapters                    | Issuer Administration, Access Control Server        |
| ENHANCEMENT | #325         | Encryption of card number in CardLoader logs                               | CardLoader                                          |
| ENHANCEMENT | #343         | IAV method option for Mastercard PSD2 in Issuer groups                     | Issuer Administration, Access Control Server        |
| ENHANCEMENT | #328         | RMI configuration option                                                   | Setup, Issuer Administration, Access Control Server |
| ENHANCEMENT | #403         | Add 3DS2 transactional data into CAAS messages                             | Access Control Server                               |
| ENHANCEMENT | #423         | MIA to notify user when device is removed from Issuer's Active Device list | Issuer Administration                               |

| Type        | Issue Number | Description                                                                               | Components                                                               |
|-------------|--------------|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| ENHANCEMENT | #429         | Remove case sensitivity of OobRequestChallengeResult.requestChallengeEnum accepted values | Access Control Server                                                    |
| FIX         | #370         | OOB deviceId length issue                                                                 | Registration Server                                                      |
| FIX         | #373         | FileNotFoundException during RBA and OOB startup                                          | Access Control Server                                                    |
| FIX         | #421         | 10-CR challenge authentication issue                                                      | Access Control Server                                                    |
| FIX         | #427         | Updated ECI values for AMEX, JCB and Diners                                               | Access Control Server                                                    |
| FIX         | #438         | Change SecureCode HMAC 256 key                                                            | Issuer Administration                                                    |
| FIX         |              | General fixes, performance and security enhancements                                      | Setup, Issuer Administration, Access Control Server, Registration Server |

## ActiveAccess v8.2.6 (Patch)

[07/05/2020]

[EOL: 29/05/2022]

| Type | Issue Number | Description                                                 | Components            |
|------|--------------|-------------------------------------------------------------|-----------------------|
| FIX  | #375         | Stop ACS from uploading CustomPages for AnyBank at start up | Issuer Administration |

| Type | Issue Number | Description                                    | Components                                                               |
|------|--------------|------------------------------------------------|--------------------------------------------------------------------------|
| FIX  | #420         | NullPointerException during SMS device loading | Access Control Server                                                    |
| FIX  | #426         | MIA Report error                               | Setup, Issuer Administration, Access Control Server, Registration Server |

## ActiveAccess v8.2.5 (Patch)

[04/05/2020]

[07/05/2022]

| Type | Issue Number | Description                                    | Components            |
|------|--------------|------------------------------------------------|-----------------------|
| FIX  | #420         | NullPointerException during SMS device loading | Access Control Server |

## ActiveAccess v8.2.4 (Patch)

[28/04/2020]

[04/05/2022]

| Type | Issue Number | Description                                    | Components            |
|------|--------------|------------------------------------------------|-----------------------|
| FIX  | #420         | NullPointerException during SMS device loading | Access Control Server |

## ActiveAccess v8.2.3 (Patch)

[24/04/2020]

[28/04/2022]

| Type | Issue Number | Description                                                                   | Components            |
|------|--------------|-------------------------------------------------------------------------------|-----------------------|
| FIX  | #419         | Issue with ACS authentication pages and authentication results cannot be seen | Access Control Server |

## ActiveAccess v8.2.2

[17/04/2020]

[24/04/2022]

| Type | Issue Number | Description                                                    | Components                   |
|------|--------------|----------------------------------------------------------------|------------------------------|
| FIX  | #371         | Fixes to Frictionless Flow, Browser, PA (Result = N)           | Access Control Server        |
| FIX  | #412         | Luna HSM KeyStore loading issue                                | Access Control Server, Setup |
| FIX  | #413         | RSA key size for new issuers and issuer groups changed to 2048 | Access Control Server, Setup |
| FIX  | #416         | Fixes to Frictionless Flow, 3RI, and NPA (Result = Y)          | Access Control Server        |

## ActiveAccess v8.2.1

[09/04/2020]

[EOL: 17/04/2022]

| Type        | Issue Number | Description                                                          | Components            |
|-------------|--------------|----------------------------------------------------------------------|-----------------------|
| ENHANCEMENT | #331         | Addition of cancel link to 3DS2 authentication pages                 | Access Control Server |
| ENHANCEMENT | #369         | Addition of "store name", "date" and "amount" to authentication page | Access Control Server |

| Type | Issue Number | Description                                                                 | Components                                             |
|------|--------------|-----------------------------------------------------------------------------|--------------------------------------------------------|
| FIX  | #349         | null cardName in verifyRegResp produces an error                            | Access Control Server                                  |
| FIX  | #371         | Changes to the validation date of cardLoader generated certificate          | CardLoader                                             |
| FIX  | #393         | Misplacement of elements in responsive view of custom pages                 | Access Control Server                                  |
| FIX  | #394         | NullPointerException error while processing regStatus=1 in CAAS             | Access Control Server                                  |
| FIX  | #395, 400    | ClientID=null not to be included in Notification Reports, OOB & RBA APIs    | Access Control Server, CardLoader, Registration Server |
| FIX  | #396         | Exception during initializing LunaProvider in gpcomp.updater                | Setup                                                  |
| FIX  | #397, #399   | Archive database schema upgrade from ActiveAccess v7.3 to ActiveAccess v8.2 | Issuer Administration, Setup                           |
| FIX  | #407         | Configuration of "ACS challenge URL" for issuers                            | Access Control Server                                  |

## ActiveAccess v8.2.0

[27/03/2020]

[EOL: 09/04/2022]

| Type        | Issue Number | Description                                          | Components                                   |
|-------------|--------------|------------------------------------------------------|----------------------------------------------|
| ENHANCEMENT | #151         | Support push notifications during OOB authentication | Access Control Server, Registration Server   |
| ENHANCEMENT | #174         | IAV method option for Mastercard PSD2                | Access Control Server, Issuer Administration |

| Type        | Issue Number | Description                                                                         | Components                                                                    |
|-------------|--------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| ENHANCEMENT | #192         | Displaying OTP+StaticPassword for CAAS                                              | Access Control Server                                                         |
| ENHANCEMENT | #221         | Displaying risk decision in Transaction Details page                                | Issuer Administration                                                         |
| ENHANCEMENT | #307         | Addition of a new card attribute: ClientID                                          | Access Control Server, CardLoader, Issuer Administration, Registration Server |
| ENHANCEMENT | #316         | Card and Transaction search performance improvement                                 | Issuer Administration                                                         |
| ENHANCEMENT | #319         | "Score range for device" in RBA allows for selection from all devices including OOB | Access Control Server                                                         |
| ENHANCEMENT | #323         | Addition of "Maximum interaction" limit for Remote Issuers                          | Access Control Server, Issuer Administration                                  |
| FIX         | #234         | Fix for CAASSESSION table lock issue                                                | Access Control Server                                                         |
| FIX         | #315         | Fix for archive and purge features                                                  | Issuer Administration                                                         |
| FIX         | #353         | Reverting Card Expiry Date to optional                                              | Issuer Administration, Registration Server                                    |
| FIX         |              | General fixes, performance and security enhancements                                | Setup, Issuer Administration, Access Control Server, Registration Server      |

## ActiveAccess v8.1.2

[10/01/2020]

[EOL: 28/02/2022]

| Type        | Issue Number | Description                                                                          | Components                                                                          |
|-------------|--------------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| ENHANCEMENT | #228         | Adding forgot password link for browser device channel                               | Access Control Server                                                               |
| ENHANCEMENT | #251         | Send tokens only when the Resend OTP link is clicked                                 | Access Control Server                                                               |
| ENHANCEMENT | #268         | Changes to PreAuth in Remote Authentication model                                    | Access Control Server                                                               |
| ENHANCEMENT | #299         | Improvements to enabling 2FA for admin users                                         | Issuer Administration                                                               |
| ENHANCEMENT | #300         | Device selection when two OOB devices are assigned to a card                         | Access Control Server                                                               |
| ENHANCEMENT | #312         | Addition of DESede support to CardLoader and Registration for backward compatibility | Registration Server, CardLoader                                                     |
| FIX         | #271         | Fixing Ping Command connection issue                                                 | Issuer Administration, Access Control Server, Registration Server, Enrolment Server |
| FIX         |              | General fixes, performance and security enhancements                                 | Setup, Issuer Administration, Access Control Server, Registration Server            |

## ActiveAccess v8.1.1

[06/12/2019]

[EOL: 10/01/2022]

| Type        | Issue Number | Description                                             | Components                      |
|-------------|--------------|---------------------------------------------------------|---------------------------------|
| ENHANCEMENT | #267         | Add new CancelReg request with optional cardholder name | Registration Server, CardLoader |

| Type        | Issue Number | Description                                             | Components                                                                          |
|-------------|--------------|---------------------------------------------------------|-------------------------------------------------------------------------------------|
| ENHANCEMENT | #271         | ActiveAccess Ping command improvement                   | Issuer Administration, Access Control Server, Registration Server, Enrolment Server |
| FIX         | #303         | Invalidate empty cardholder name in PreReg and FinalReg | Registration Server, CardLoader                                                     |

## ActiveAccess v8.1.0

[15/11/2019]

[EOL: 06/12/2021]

| Type        | Issue Number | Description                                                                    | Components                                   |
|-------------|--------------|--------------------------------------------------------------------------------|----------------------------------------------|
| ENHANCEMENT | #92          | Acceptable values for App unsupported devices updated                          | Access Control Server, Issuer Administration |
| ENHANCEMENT | #131         | Supporting two-factor authentication for local authentication                  | Access Control Server, Issuer Administration |
| ENHANCEMENT | #142         | Changing the risk/rule decision process                                        | Access Control Server                        |
| ENHANCEMENT | #143         | Provide a mechanism to test OOB and RBA restful adapters connect/read timeouts | Access Control Server, Issuer Administration |
| ENHANCEMENT | #179         | Including more data in RBA call back                                           | Access Control Server                        |
| ENHANCEMENT | #198         | Updating the approach of populating the historical transaction for RBA         | Access Control Server                        |
| ENHANCEMENT | #201         | Create a swagger for OOB and Risk restful adapters                             | Access Control Server                        |
| ENHANCEMENT | #246         | Enabling language selection during authentication for 3DS1                     | Access Control Server, Issuer Administration |

| Type        | Issue Number | Description                                                          | Components            |
|-------------|--------------|----------------------------------------------------------------------|-----------------------|
| ENHANCEMENT | #273         | Http protocol version for external connections                       | Access Control Server |
| FIX         | #53          | 3DS method notification post data                                    | Access Control Server |
| FIX         | #95          | ACS decision based on risk chain score in remote authentication      | Access Control Server |
| FIX         | #260         | HSM installation issues                                              | Setup                 |
| FIX         | #266         | Detach SDK certificates from Issuer Certificates                     | Setup                 |
| FIX         | #278         | CAAS Server throws NullPointerException when message category is NPA | Access Control Server |

## ActiveAccess v8.0.4

[06/11/2019]

[EOL: 15/11/2021]

| Type | Issue Number | Description                      | Components            |
|------|--------------|----------------------------------|-----------------------|
| FIX  | #281         | Invalid Request to Remote Server | Access Control Server |

## ActiveAccess v8.0.3

[25/10/2019]

[EOL: 06/11/2021]

| Type | Issue Number | Description                                   | Components   |
|------|--------------|-----------------------------------------------|--------------|
| FIX  | #277         | Deployment of registration.war during startup | Registration |

| Type | Issue Number | Description                                                     | Components            |
|------|--------------|-----------------------------------------------------------------|-----------------------|
| FIX  | #278         | CAAS throws a NullPointerException when message category is NPA | Access Control Server |

## ActiveAccess v8.0.2

[09/10/2019]

[EOL: 25/10/2021]

| Type        | Issue Number | Description                                                                                     | Components                                   |
|-------------|--------------|-------------------------------------------------------------------------------------------------|----------------------------------------------|
| ENHANCEMENT | #51          | Support 3DS2 purchase amount 0 for Mastercard IDC                                               | Access Control Server                        |
| ENHANCEMENT | #98          | Update ECI for Message Category NPA for Mastercard IDC                                          | Access Control Server                        |
| ENHANCEMENT | #219         | Making acsReferenceNumber configurable for testing purposes                                     | Issuer Administration, Access Control Server |
| ENHANCEMENT | #223         | Addition of decline code to preAuthResp of CAAS                                                 | Access Control Server                        |
| ENHANCEMENT | #229         | Addition of KeyStore and TrustStore for RBA Server                                              | Access Control Server                        |
| ENHANCEMENT | #233         | Addition of KeyStore and TrustStore for OOB Server                                              | Access Control Server                        |
| FIX         | #132         | Updates to Mastercard IDC status codes                                                          | Access Control Server                        |
| FIX         | #148         | Remote CAAS PreAuth changes                                                                     | Access Control Server                        |
| FIX         | #226         | Setup could not generate RSA2048 keys for the MAP error during Luna PKCS11 installation/upgrade | Setup                                        |

| Type | Issue Number | Description                                                                               | Components                                                               |
|------|--------------|-------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| FIX  | #242         | Verified by Visa references changed to Visa Secure in the content of authentication pages | Access Control Server                                                    |
| FIX  |              | General fixes, performance and security enhancements                                      | Setup, Issuer Administration, Access Control Server, Registration Server |

## ActiveAccess v8.0.1

[05/09/2019]

[EOL: 02/10/2021]

| Type        | Issue Number | Description                                                  | Components                                          |
|-------------|--------------|--------------------------------------------------------------|-----------------------------------------------------|
| ENHANCEMENT | #169         | EULA update                                                  | Issuer Administration                               |
| ENHANCEMENT | #208         | Grant scripts run automatically during setup                 | Setup                                               |
| FIX         | #172         | Device selection page isn't being shown                      | Access Control Server                               |
| FIX         | #182         | Device registration fails when issuer has OOB device enabled | Access Control Server                               |
| FIX         | #186         | Exception raised during Diners Club remote authentication    | Access Control Server                               |
| FIX         | #188         | ChallengeResponse failure in remote authentication           | Access Control Server                               |
| FIX         | #189         | Risk adapter configuration page issue                        | Issuer Administration                               |
| FIX         | #193         | Generate RSA 2048 when the EC key generation fails           | Setup, Issuer Administration, Access Control Server |

| Type | Issue Number | Description                                                   | Components                                                               |
|------|--------------|---------------------------------------------------------------|--------------------------------------------------------------------------|
| FIX  | #196         | CardLoader setup.sh doesn't work                              | CardLoader                                                               |
| FIX  | #203         | Upgrade issue from 7.4.2 to 8.0.0 with currency exchange rate | Setup                                                                    |
| FIX  |              | General fixes, performance and security enhancements          | Setup, Issuer Administration, Access Control Server, Registration Server |

## ActiveAccess v8.0.0

[15/08/2019]

[EOL: 05/09/2021]

| Type        | Issue Number | Description                                          | Components                                                               |
|-------------|--------------|------------------------------------------------------|--------------------------------------------------------------------------|
| ENHANCEMENT | #93          | Enhancements to the Administration interface (MIA)   | Issuer Administration                                                    |
| ENHANCEMENT | #5468        | Support incremental database schema changes in Setup | Setup                                                                    |
| ENHANCEMENT | #5801        | Web Container Neutralization                         | Setup                                                                    |
| ENHANCEMENT | #6659        | Support for 3-D Secure 2.1                           | Setup, Issuer Administration, Access Control Server, Registration Server |
| ENHANCEMENT | #6661        | 3DS2 Transaction search based on 3DS version         | Issuer Administration                                                    |
| ENHANCEMENT | #6663        | Support for 3DS2 Risk Management                     | Issuer Administration, Access Control Server                             |
| ENHANCEMENT | #6664        | Support 3DS2 Reporting                               | Issuer Administration                                                    |

| Type        | Issue Number | Description                                                                                                 | Components                                          |
|-------------|--------------|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| ENHANCEMENT | #7207        | Support for OOB Processing                                                                                  | Issuer Administration, Access Control Server        |
| ENHANCEMENT | #7383        | Substitute Triple DES encryption in ActiveAccess with stronger cryptography                                 | Issuer Administration, Access Control Server        |
| ENHANCEMENT | #7845        | Removal of RuPay component                                                                                  | Setup, Issuer Administration                        |
| ENHANCEMENT | #7880        | Two-factor authentication for MIA login                                                                     | Issuer Administration                               |
| ENHANCEMENT | #8082        | Simplify the setup process                                                                                  | Setup                                               |
| ENHANCEMENT | #8310        | SPA2 algorithm for AAV generation                                                                           | Setup, Issuer Administration, Access Control Server |
| FIX         | #5425        | MIA allows exceeded password length and updates it successfully                                             | Access Control Server                               |
| FIX         | #7297        | Adminlog and AuditlogCollectorErrors have been updated to fix the errors that occurred during scheduler job | Access Control Server                               |
| FIX         | #8160        | Authentication Exemption Rules for CAAS server                                                              | Access Control Server                               |

## ActiveAccess v7.4.7 (Patch)

[23/03/2019]

[EOL: 15/08/2021]

| Access Control Server |       |                                                                                    |
|-----------------------|-------|------------------------------------------------------------------------------------|
| FIX                   | #8147 | Fixed the purchAmount field to avoid the mismatch of value between PAREs and PAREq |

## ActiveAccess v7.4.6 (Patch)

[05/03/2019]

[EOL: 23/03/2021]

| Issuer Administration |  |  |
|-----------------------|--|--|
|-----------------------|--|--|

|     |       |                                                 |
|-----|-------|-------------------------------------------------|
| FIX | #8022 | Removing "+" sign when sending message via JMS. |
|-----|-------|-------------------------------------------------|

| Access Control Server |  |  |
|-----------------------|--|--|
|-----------------------|--|--|

|     |       |                                                 |
|-----|-------|-------------------------------------------------|
| FIX | #8022 | Removing "+" sign when sending message via JMS. |
|-----|-------|-------------------------------------------------|

## ActiveAccess v7.4.5 (Patch)

[01/02/2019]

[EOL: 05/03/2021]

| Access Control Server |  |  |
|-----------------------|--|--|
|-----------------------|--|--|

|             |       |                                                              |
|-------------|-------|--------------------------------------------------------------|
| ENHANCEMENT | #7843 | Displaying the Mobile Number on Remote Authentication pages. |
|-------------|-------|--------------------------------------------------------------|

|             |       |                                                                                 |
|-------------|-------|---------------------------------------------------------------------------------|
| ENHANCEMENT | #7893 | Adding PurchaseExponent attribute to the transaction table of requests to CAAS. |
|-------------|-------|---------------------------------------------------------------------------------|

## ActiveAccess v7.4.4 (Patch)

[27/09/2018]

[EOL: 01/02/2021]

| Issuer Administration |  |  |
|-----------------------|--|--|
|-----------------------|--|--|

|     |       |                                                                                                                                     |
|-----|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| FIX | #7748 | SMS delivery fails as ACS sends the phone number without the '+' sign to SMPP client. ACS now includes the + sign when sending SMS. |
|-----|-------|-------------------------------------------------------------------------------------------------------------------------------------|

**Access Control  
Server**

|     |       |                                                                                                                                     |
|-----|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| FIX | #7748 | SMS delivery fails as ACS sends the phone number without the '+' sign to SMPP client. ACS now includes the + sign when sending SMS. |
|-----|-------|-------------------------------------------------------------------------------------------------------------------------------------|

## ActiveAccess v7.4.3 (Patch)

[18/09/2018]

[EOL: 27/09/2020]

**Issuer  
Administration**

|     |       |                                                                                                                                                   |
|-----|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| FIX | #7718 | Card Registration File Upload Errorcard file. Clearing the timer to prevent "java.lang.IllegalStateException: Timer already canceled" exceptions. |
|-----|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|

## ActiveAccess v7.4.2

[20/08/2018]

[EOL: 07/06/2020]

**Issuer Administration**

|             |       |                                              |
|-------------|-------|----------------------------------------------|
| ENHANCEMENT | #7543 | ISO 3166 Update country details for Eswatini |
|-------------|-------|----------------------------------------------|

|             |       |                               |
|-------------|-------|-------------------------------|
| ENHANCEMENT | #7654 | ISO 4217 Amendment Number 169 |
|-------------|-------|-------------------------------|

**Active Control Server**

|             |       |                                              |
|-------------|-------|----------------------------------------------|
| ENHANCEMENT | #7543 | ISO 3166 Update country details for Eswatini |
|-------------|-------|----------------------------------------------|

|             |       |                               |
|-------------|-------|-------------------------------|
| ENHANCEMENT | #7654 | ISO 4217 Amendment Number 169 |
|-------------|-------|-------------------------------|

|     |       |                                                |
|-----|-------|------------------------------------------------|
| FIX | #7677 | CurrencyExchange error in ActiveAccess startup |
|-----|-------|------------------------------------------------|

**Registration Server**

|     |       |                               |
|-----|-------|-------------------------------|
| FIX | #7639 | Card Registration File Upload |
|-----|-------|-------------------------------|

## ActiveAccess v7.4.1 (Patch)

[08/08/2018]

[EOL: 20/08/2020]

**Issuer Administration**

|     |       |                                                      |
|-----|-------|------------------------------------------------------|
| FIX | #7557 | Verification code not received for Email device type |
|-----|-------|------------------------------------------------------|

**Active Control Server**

|     |       |                             |
|-----|-------|-----------------------------|
| FIX | #7482 | Custom Pages layout updates |
|-----|-------|-----------------------------|

|     |       |                                                      |
|-----|-------|------------------------------------------------------|
| FIX | #7557 | Verification code not received for Email device type |
|-----|-------|------------------------------------------------------|

## ActiveAccess v7.4.0

[06/07/2018]

[EOL: 08/08/2020]

**Setup**

|             |       |                                       |
|-------------|-------|---------------------------------------|
| ENHANCEMENT | #6479 | External HSM setup - PKCS #11 Support |
|-------------|-------|---------------------------------------|

|             |       |                                  |
|-------------|-------|----------------------------------|
| ENHANCEMENT | #7470 | Update key type for CVC2 process |
|-------------|-------|----------------------------------|

|             |       |                               |
|-------------|-------|-------------------------------|
| ENHANCEMENT | #7471 | HMAC key length update for MC |
|-------------|-------|-------------------------------|

|             |       |                                            |
|-------------|-------|--------------------------------------------|
| ENHANCEMENT | #7477 | Support HSMs in which DES is not available |
|-------------|-------|--------------------------------------------|

|             |       |                                                  |
|-------------|-------|--------------------------------------------------|

| FEATURE:     | #5546 | Supports Amex Safekey compliance (rev 2016)                         |

| Issuer Administration |       |                                                                                                                                                                |
|-----------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIX:                  | #5525 | Encrypt critical data in case of registration failure                                                                                                          |
| FIX:                  | #5899 | Archive history details page display error                                                                                                                     |
| SUPPORT:              | #5729 | Visa Intermediate SHA2 CA cert added for new installations                                                                                                     |
| ENHANCEMENT:          | #5574 | Remove usage of deprecated JRE classes                                                                                                                         |
| ENHANCEMENT:          | #5740 | Exclusion of third party XML parser libraries (JAXP libraries),Third party XML parser libraries (JAXP libraries) excluded and replaced with JDK JAXP libraries |
| ENHANCEMENT:          | #5829 | Remove restriction on using previous CAVV key                                                                                                                  |
| ENHANCEMENT:          | #5874 | Support p7 and der files when installing certificates                                                                                                          |
| ENHANCEMENT:          | #5939 | Encode HSM_PASSWORD parameter (Base64) in ActiveAccess config files                                                                                            |
| FEATURE:              | #5546 | Supports Amex Safekey compliance (rev 2016)                                                                                                                    |

| Access Control Server |       |                                                                                                                                                                |
|-----------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIX:                  | #4584 | Improve PCI Key Retiring utility performance*                                                                                                                  |
| FIX:                  | #5965 | CAAS Card Auth Data format not found error. The error message is logged in ACS logs during a remote transaction regardless of success of the transaction.      |
| FIX:                  |       | Various spelling corrections in application and XSL files                                                                                                      |
| SUPPORT:              | #5748 | Error in restarting Number of authentication exemptions and Sum of exempted authentications' amounts when empty cardholder name is received from CAAS server   |
| SUPPORT:              | #5785 | Unable to establish connection to CAAS                                                                                                                         |
| SUPPORT:              | #5903 | Optimise GET_CARDS procedure                                                                                                                                   |
| SUPPORT:              | #5952 | Update American Express SafeKey logo                                                                                                                           |
| ENHANCEMENT:          | #5054 | Support SafeNet Network HSM (Cloud HSM/Luna SA)                                                                                                                |
| ENHANCEMENT:          | #5546 | Compliance with American Express Safekey (revision 2016)                                                                                                       |
| ENHANCEMENT:          | #5574 | Remove usage of deprecated JRE classes                                                                                                                         |
| ENHANCEMENT:          | #5740 | Exclusion of third party XML parser libraries (JAXP libraries),Third party XML parser libraries (JAXP libraries) excluded and replaced with JDK JAXP libraries |
| ENHANCEMENT:          | #5939 | Encode HSM_PASSWORD parameter (Base64) in ActiveAccess config files                                                                                            |
| FEATURE:              | #5546 | Supports Amex Safekey compliance (rev 2016)                                                                                                                    |

| Enrolment Server |       |                                                           |
|------------------|-------|-----------------------------------------------------------|
| FIX:             |       | Various spelling corrections in application and XSL files |
| ENHANCEMENT:     | #5574 | Remove usage of deprecated JRE classes                    |

| Enrolment Server |  |  |
|------------------|--|--|
|------------------|--|--|

ENHANCEMENT: #5740 Exclusion of third party XML parser libraries (JAXP libraries),Third party XML parser libraries (JAXP libraries) excluded and replaced with JDK JAXP libraries

ENHANCEMENT: #5939 Encode HSM\_PASSWORD parameter (Base64) in ActiveAccess config files

| Registration Server |  |  |
|---------------------|--|--|
|---------------------|--|--|

SUPPORT: #5767 Changing request Id length in notification request to be at most 1024 characters

ENHANCEMENT: #5574 Remove usage of deprecated JRE classes

ENHANCEMENT: #5740 Exclusion of third party XML parser libraries (JAXP libraries),Third party XML parser libraries (JAXP libraries) excluded and replaced with JDK JAXP libraries

ENHANCEMENT: #5939 Encode HSM\_PASSWORD parameter (Base64) in ActiveAccess config files

| RuPay |  |  |
|-------|--|--|
|-------|--|--|

FIX: #5482 Search by Error Code field in Transaction screens

FIX: #6025 RuPay verifyRegistration did not forward contextBlob to initAuthentication. contextBlob now included

FIX: #6026 Support authType in addition to authTypeSupList in RuPay

| Card Loader |  |  |
|-------------|--|--|
|-------------|--|--|

FIX: #5779 CardLoader now supports Java 8

SUPPORT: #5767 Changing request Id length in notification request to be at most 1024 characters

ENHANCEMENT: #5574 Remove usage of deprecated JRE classes
